SPACE

GAME

SPACEY GAMEY

A game of ship-to-ship combat in outer space

Spacey Gamey is a fast-paced game in which each player literally "creates" their own ships and then uses them to try and destroy other player's ships.

Spacey Gamey differs largely from similar games because it is easy to learn and combat usually lasts less than one hour depending upon the number of participants.

© 1984, Gemini Games

SEQUENCE OF PLAY

1. Create your spaceship using the Buyer's Guide. Each player gets a ship hull which has 50 hull points and 12,000 credits to spend equipping their ship.
2. Draw a picture, letter, or symbol on one of the blank white counters provided to represent your ship. Also, be sure to name your ship.
3. Decide what "class game" everyone wants to play.
4. Place the counters equal distances from one another on the outer row of hexes on the map.
5. Roll two six-sided dice to see who goes first, the rest proceeding in a clockwise direction from the high roller.
6. Conduct combat until the proper number of "winners" has been decided.
7. Roll 4 sided die (dice) for additional credits if you are a winner in the scenario.
8. Readjust the value of your ship depending upon what was used and how many credits were earned.

RULES FOR SPACEY GAMEY

A. Creating your ship

1. Each player begins the game with a ship hull which has 50 hull points and 12,000 "credits" to spend equipping their ship.
2. Players may either choose a conventional ship or a solar ship. Conventional ships can only use conventional equipment and solar ships can only use solar equipment. Both type of ships can freely use computer and ramming equipment.
3. Each player may create as many ships as they desire and each ship should be given a name.
4. Participants may play as many ships as they desire as long as each player plays the same number of ships and the total number of ships on the map does not exceed 12.

B. Rules for movement

1. Movement is dictated by Thrusters, Solar Thrusters, Mini-Thrusters, Impulse Engine Capability, and by a Hyperspace Device.
2. Each ship may have as many thrusters as it can afford but each vessel may only have 1 impulse engine and 1 hyperspace device.
3. An impulse engine moves a ship 1 hex, a mini-thruster moves a ship 2 hexes, a solar thruster moves a ship 3 hexes, a conventional thruster moves a ship 4 hexes, and a hyperspace device causes a ship to appear random on the map surface.
4. Thrusters and mini-thrusters are cumulative in movement as are solar thrusters on a solar ship. Thus, a ship with two thrusters may move either 4 or 8 hexes per turn. Also, a solar ship with two solar thrusters may move either 3 or 6 hexes per turn. Note, however that an impulse engine is not cumulative with thruster movement. It is an independent form of movement.
5. The hyperspace device causes a ship to appear at random on the map surface. When this device is used no one will know where the ship will appear. To determine where the ship will appear, first roll a six-sided die to determine in which of the six quadrants it will appear. Then roll a "10" sided die to determine where in the quadrant it will appear left-to-right. Finally, roll another 20 sided die to determine where in in the quadrant it is top-to-bottom. After this, simply cross match the two numbers and this will be the hex in which the ship is to be placed.
6. If a ship has both thruster and hyperspace capability, it may move and then hyperspace or hyperspace and then move but it cannot move-hyperspace-and move some more.
7. A ship may move in any direction it desires, including backwards, with no movement penalty.
8. A ship may never leave the map surface and return during the same scenario.

C. Rules for combat

1. Combat can only occur during each players movement turn. The person moving may attack at any time during their movement, however. Thus, a player can attack then move, move and then attack, or move-attack-and move some more.

2. To determine whether or not you "hit" an opponent, consult the "to hit" chart. First, determine the range (in hexes) between you and your opponent by counting the number of hexes in as straight a line as possible between the two ships. After determining the range, cross match it with the appropriate attack form used. This will show you a number between 0-20. This number or higher is what must be rolled on a 20 sided die in order to successfully hit an opponent. If an opponent is successfully hit, then damage is rolled according to the attack form used. Note: Damage is not rolled for plasma, if it hits it does 30 points of damage automatically.

3. Two attack forms do not necessitate a "to hit" roll, they are rockets and nuclear missiles. Rockets only hit if the opponent is within range. Rocket damage depends upon the actual distance from the opponent, the closer the opponent the greater the damage. To find this damage consult the "to hit" chart under the "rocket" heading.

4. Nuclear Missiles also do not require a "to hit" roll. Nuclear Missiles are fired from missile launchers and automatically move 1 hex per turn on their own. Also, missile thrusters may be purchased to add speed to nuclear missiles. Each missile thruster moves a nuclear missile 4 hexes and a maximum of two missile thrusters per nuclear missile may be purchased. Thus, a nuclear missile has a maximum movement of 8 hexes per turn. For the firing of a nuclear missile there are two options: One is to move within range of an opponent and then launch the missile(s). If this is done, it automatically hits and damage is rolled. The second option is to launch the missile(s) even if the opponent is not in range. To do this, place a counter representing the nuclear missile on the map and move it the appropriate number of hexes toward the intended opponent. Players may draw a missile or write NM on one of the extra blank counters to represent the nuclear missiles. Nuclear Missiles launched in this manner may be destroyed if an attack form hits it and does 10 or more points of damage. If it is not destroyed it will continue toward its opponent until it hits the opponent. These missiles may be controlled and redirected by the ship that fired them unless the ship which did so was destroyed. If this occurs, the missiles will continue toward the ship they were attacking when the ship firing the missiles was destroyed.

5. Ships may only fire against one ship per turn unless the ship has a Basic-on-board-computer (BOBC) with a multi-ship program which allows firing against as many opponents as desired.

6. Any time any attack form hits, a check must be made to determine if the hit was in a critical area of the ship. This is done by rolling two six-sided dice, if a 2 or 12 is rolled then a critical hit has occurred. If a BOBC with a crit-hit program is owned then a 2, 3, 11, or 12 indicates a crit-hit. If a crit-hit is rolled then another six-sided die is rolled to determine if the hit permanently damages something on the opponents ship or if the crit-hit only does normal surface damage. If a 1-4 is rolled it is only a normal surface hit and if a 5 or 6 is rolled it is a permanent crit-hit. If a BOBC with a crit-hit program is owned then a 1-3 indicates a surface hit and a 4-6 indicates a permanent crit-hit. The only two things which cannot be hit critical are the solar power converter and the BOBC. Everything else on a ship can be hit critical and should be numbered in the event of a crit-hit. A die roll to determine exactly what is hit should be made according to the number of items a ship has.

7. Areas designated as critical are: Photon Tubes, Photon Compartment, Laser Beams, Beam Rechargers, WLTB, Disperser, Plasma Compartments, Cannons, Cannon Shell Compartments, Solar Generators, Solar Flares, Sunbursts, Rocket Launchers, Tripods, Rocket Compartments, all Thrusters and Shields, Impulse Engine, Hyperspace Device, Missile Launchers, and Nuclear Missile Compartments. All players should specify how many Photons, Cannon Shells, Nuclear Missiles, Plasmas, and Rockets are in each compartment. If any of these compartments are crit-hit permanently then the ship possessing them will take damage accordingly;

WEAPON	SHIP DAMAGE
PHOTONS	3 D 6 OF DAMAGE PER PHOTON IN COMPARTMENT
CANNON SHELLS	2 D 6 OF DAMAGE PER SHELL IN COMPARTMENT
ROCKETS	6 POINTS OF DAMAGE PER ROCKET IN COMPARTMENT
NUCLEAR MISSILES	20 D 6 PER NUCLEAR MISSILES IN COMPARTMENT
PLASMAS	30 POINTS OF DAMAGE PER PLASMA IN COMPARTMENT

NOTE: The ship taking damage will not be aided by shields because the explosion occurs within the ship. If crit-hit permanently, Nuclear Missiles and Plasmas explode doing damage to every ship within the same hex as the explosion. These other ships in the same hex will be able to reduce this damage if they have conventional shields.

8. Shields--Shields aid greatly in reducing damage if fighting against the same type of ship. Solar Shields do not help against conventional weapons and conventional shields do not help against solar weapons. Each shield causes the opponent to subtract 1 from their die roll "to hit" and 1 from each die of damage rolled. In any event however, every die does a minimum of 1 point of damage regardless of shield subtraction.

9. A ship is destroyed when it takes damage equivalent to or greater than the number of hull points it has.

10. If a ship is among the winners of a scenario or it leaves the map, all hull points lost are restored, and all broken equipment is repaired at no cost. However, all Photons, Cannon Shells, Rockets, Nuclear Missiles, and Plasmas must be replaced in order to have them when the next scenario begins.

11. Ramming--Ships may ram one another only if they have a ramming device. Ramming damage is determined by the range between the ramming ship and its target ship. The ship rammed takes one 6 sided die of damage per hex it is away from the ramming ship. Even though the ramming ship may have enough thrusters to practically encircle the ship to be rammed, it must ram in the most direct path as possible (i.e. the fewest number of hexes as possible). Damage to the ramming ship is exactly half of the damage it inflicts to the rammed ship. If the ramming ship has a de-rammer then it takes one-fourth of the damage inflicted. Any ship may buy a derammer which causes damage taken by rams to be halved. All ramming ships must end their movement in the same hex as the ship it has rammed. It cannot even hyperspace after a ram.

12. No player can tell whether or not they are facing the same ship they have previously encountered unless they have a BOBC with a history program.

13. Computers--In order to run programs, a Basic-On-Board-Computer must first be bought. If a BOBC has been bought then a player may buy any program(s) they desire. Also, if more than one program is bought or a master program is in use, they may all function at the same time.

14. Beam Weapons--The amount of dice a player may buy for their beam, solar flare, or sunburst is limitless and no matter how many dice the beam weapon may have it only needs one recharger/generator. Note: If more than one beam weapon is owned then additional rechargers/generators must be purchased. Also, each "type" of beam or solar flare requires a recharger/generator.

D. WINNING THE GAME

1. Spacey Gamey differs from other games in that ships that win or leave the map may continue to play in other scenarios. Thus, ships that continue to win become more and more powerful. Because of this all ships are required to keep track of how many credits their ship is presently worth. This is done by adding together the value of all equipment, extra hull points, rockets, shells, etc...To prevent very powerful ships from continually obliverating smaller ships the following class structure has been devised;

CLASS	VALUE OF SHIP IN CREDITS
1	12,000-21,999
2	22,000-31,999
3	32,000-41,999
4	42,000-51,999
5	52,000-61,999
6	62,000-71,999
7	72,000-81,999
etc....	

All ships must play within their own class to help keep the game in perspective. At the start of each scenario the players should determine what "class game" they wish to play. Note: Ships which are in a lower class than the "class game" being played may play their ships at their own risk.

2. Every scenario has a different number of "winners" dependent on the number of players competing. Scenarios with more than one winner present an option for the remaining survivors. They may, (A). Call a truce and all collect equal earnings, (B) Leave the map and assure themselves of winning earnings equal to the number of winning survivors at the time of exit from the map, or (C). Fight it out for the extra earnings.

3. The amount of credits a player receives is dependent upon the number of participants as follows:

NUMBER OF PLAYERS	NUMBER OF WINNERS	NUMBER OF CREDITS
2 OR 3	1	1-4,000
4 OR 5	2	2-8,000
6 OR 7	3	3-12,000
8 OR 9	4	4-16,000
10 OR 11	5	5-20,000
12	6	6,26,000

Ships receiving additional credits may use them in any manner they wish. They may replace lost photons, cannon shells, rockets, missiles, and plasmas, or buy additional armaments, shields, computer and ramming equipment, or additional hull points. Thus, the credit value of each ship must be readjusted after each scenario.

4. If players wish to create their own scenarios or use an alternate classing system they are encouraged to do so in order to fit their own gaming needs. All experimentation should prove interesting in any event.

E. EXPLANATION OF TERMS

Accurator Program--A computer which gives all weapons fired a -1 to the die roll needed "to hit" an opponent. For example, a Photon generally takes a 9 to hit from the range of 11 to 15 but with an Accurator Program it only takes an 8 to hit from the same distance.

Basic On Board Computer (BOBC)--An Operational computer which is necessary to run any of the programs. It is centrally located on a ship and can never be hit crit.

Beam Recharger--Allows for the firing of any one type of laser beam each round. Without it, a ship could only fire a laser beam one time per scenario.

Cannon--An explosive short-range weapon which is similar to the traditional cannon yet is much lighter and designed for space travel.

Conventional Thruster--The thruster used on conventional ships. It moves a ship 4 hexes.

Credits--A unit in which all things are purchased and the unit winnings are received. These credits are bestowed to players by large companies desiring to observe battle tactics and equipment testing. Credits from winning are due to factors such as companies' continued support, experience, and salvage.

Crit-Hit Program--A computer program which makes it easier to hit an opponent's ship in the critical location. With a Crit-Hit Program a die roll of 2, 3, 11, or 12 on a 2 die 6 indicates a crit hit and a 4, 5, or 6 indicates a permanent crit-hit.

De-Rammer--A protective shield-like layer around the ship's body which causes damage from rams to be halved. It is not like other shields and does not aid in other weapon attacks.

Disperser--A conventional weapon which disperses a conventional ray of energy at opposing ships. A disperser does 4 d 6 of damage.

Hex--The six-sided figures found on the map which form together to comprise the playing area. The map is 60 hexes long and 40 hexes wide.

History Program--A computer program which will instantly identify the other ships on the map if those ships have previously been encountered by the ship with the history program. It will reveal everything that these ships had on them (equipment, weapons, hull points, etc...) at the time the ship was previously encountered. It will not reveal what new equipment has been purchased if the opposing ship(s) has new equipment not yet seen by the ship with the history program.

Hull Points--A measure of how thick a ship's outer body is. Additional Hull Points are a result of strengthening the ship's body by adding more steel, better material and larger compartments.

Hyperspace--A device triggered by the pushing of a button which causes the ship to appear at random on the map surface.

Impulse Engine--An older engine type which moves conventional ships 1 hex. It is an independent form of movement and cannot work in conjunction with any thruster. it can however, be used in conjunction with a hyperspace device.

Laser Beam--A laser beam is a weapon which is broken down into 6 types according to the concentration of the particles. A Type I Beam is sparcely concentrated and thus does only 4 sided dice in damage. A Type VI Beam is very concentrated and thus does 20 sided of damage.

Mini-Thruster--A small thruster which moves a conventional ship 2 hexes.

Missile Launcher--A cylindrical tube in which both nuclear missiles and plasmas are fired from.

Missile Thruster--A very small thruster which is placed onto nuclear missiles to increase their speed. Each missile thruster causes a nuclear missile to move 4 hexes per turn. Up to 2 missile thrusters may be placed on each missile.

Multi-Ship Program--A computer program which allows a ship to fire at as many different ships per turn as it desires.

Nuclear Missile--A large missile with a nuclear warhead. It does 20 d 6 of damage.

Photon--A small, sperical bundle of energy which has a very long range. Photons do 3d6 of damage.

Photon Tube--A strong metallic tube extending to a portal on the ship's outer surface. A ship must have photon tubes to launch photons.

Plasma--A large, thick ball of energy which is launched from missile launchers. Plasma's always do 30 points of damage when they hit.

Rammer--A large metallic "nose" put on a ship which enables it to ram other ships. Note: Shields do not aid in reducing ramming damage.

Rockets--Small, self-propelled projectiles which always hit their target if in range. Damage from rockets depends upon the actual distance from the opposing ship.

Rocket Launcher--A short tube which fires rockets from a ship. A ship must have either a rocket launcher or a tripod in order to fire rockets.

Scenario--One complete battle in which winners and losers are determined.

Shield--An outer protective shell around a ship. Ships may have a maximum of 3 shields. Each shield causes the opponent to subtract 1 from their die roll "to hit" and 1 from each die of damage. Thus, up to -3 "to hit" and -3 on each die of damage. Note: Damage per die is always a minumum of 1 point regardless of subtractions.

Solar Flare--A solar weapon similar to laser beams in regard to types and concentration. A solar flare resembles a roman candle when it is fired.

Solar Generator--A power-building device which enables solar flares and sunbursts to fire every turn. Without it solar flares and sunbursts can fire only once per scenario.

Solar Power Converter-(SPC)--The large sun-gathering mechanism which makes a ship solar. All solar ships must have an SPC in order to function.

Solar Thruster--A thruster which moves solar ships 3 hexes.

Sunburst--An explosive burst of solar energy. It fires in a slightly cone-shaped manner but only affects 1 opponent per turn.

Sunscreen Shield--A solar shield which resists solar attacks in the exact manner as conventional shields as described above. A maximum of 3 may be purchased.

Tripod--A system of 3 entertwining rocket launchers. Tripods fire 3 rockets each per turn.

Turn--When each player has completed one round of moving and attacking.

Whip-Lash-Thunder-Bolt-(WLTB)--A powerful discharge of electrical energy which does 6d6 of damage. A WLTB is unique because it may be used by conventional and solar ships alike. Also, no shields ever work against a WLTB. This applies to the "to hit" roll and the damage roll.

SAMPLE SHIPS

SHIP A. CONVENTIONAL
HP: 50
1. THRUSTER-2,000
2. 2 D TYPE V BEAM -3,000
3. BEAM RECHARGER-1,000
4. 1 D TYPE VI BEAM-2,500
5. BEAM RECHARGER-1,000
6. 1 PHOTON TUBE-1,000
7. 10 PHOTONS-500
8. 1 SHIELD-1,000

TOTAL CREDITS-12,000

SHIP B. SOLAR
HP: 60
SOLAR POWER CONVERTER-1,000
1. SOLAR THRUSTER-1,000
2. 2 D TYPE III FLARE-2,500
3. SOLAR GENERATOR-1,000
4. 6 D SUNBURST-3,000
5. SOLAR GENERATOR-1,000
BOBC-1,000
TYPE I PROGRAM-1,000
10 ADDITIONAL HULL POINTS-500
TOTAL CREDITS-12,000

DESCRIPTION OF SHIPS

Ship A is a conventional ship which has 1 thruster, thus giving it a movement of 4 hexes per turn. It also has a 2 die (2 dice at 1,500 per die or 3,000 credits) Type V Beam which does 2 d 12 of damage when it hits. The beam also has a recharger which allows the beam to fire every turn. Ship A also has a 1 die Type VI Beam which does 1 d 20 when it hits. This beam also has a beam recharger. The next item ship A bought is a photon tube which fires photons, it also bought 10 photons to use. Had it not bought any photons it obviously could not fire any photons. The last thing ship A bought is a shield. Now it has spent 12,000 credits and since no additional hull points were purchased it has 50 hull points.

Ship B is Solar Ship so the first thing it had to buy was a solar power converter. Ship B bought 1 thruster so it can move 3 hexes per turn. For weapons, it bought a 2 d Type III Flare with generator and a 6 d Sunburst also with a generator. Ship B also bought a BOBC with a Type I program (crit-hit program). With the final 500 points Ship B bought 10 additional hull points giving it a total of 60 hull points.

EXAMPLE OF COMBAT

The first thing the two ships do is place their counters equal distances from one another on the map. For a two player game, one ship is to be placed in the center of quadrant 2 on the outer row of hexes closest to the edge of the map, the other ship does the same thing yet in quadrant 5. Next, both players roll 2 six sided dice to see who goes first. Ship A rolls a 6 and Ship B rolls a 9 so it goes first. Ship B moves 3 hexes toward Ship A and counts the distance between the two ships. After determining the distance to be 36 hexes, Ship B checks the "to hit" chart to see what it takes to hit with its solar flare (the sunburst is out of range). Ship B finds that it will take an 18 to hit and because Ship A is conventional, its shield will not make any difference on this roll. Ship B rolls a 13 and misses. Now it is Ship A's turn. First, it moves forward 4 hexes making the range 32 hexes. The only weapon in range is a photon and a check of the chart shows that a 14 is needed. Ship A rolls an 18 and hits Ship B, now it rolls 3d6 for damage and rolls an 11. After rolling damage, Ship A rolls 2d6 to see if the hit was critical. A 7 is rolled so it was not a crit-hit. Ship B must subtract 11 hull points from its original total leaving it with 49 hull points. Next, Ship A moves forward 3 more hexes making the range 29, Now it can fire both the solar flare and the sunburst. It takes a 15 to hit with the flare and an 18 to hit with the sunburst. Ship B rolls a 17 with the flare and a 1 with the sunburst, so it hit with the flare and rolls 2d10 for damage and rolls a 12. Ship A now has 38 hull points left. After checking for a crit-hit and rolling a 10 it becomes Ship A's turn once again. Ship A moves 4 hexes making the range 25. By checking the chart, Ship A finds that it will take a 16 for the beams to hit and a 12 for the photon to hit. Ship A rolls a 16 for the Type V Beam, a 7 with the Type VI Beam, and a 14 with the photon. Ship A rolls for 2 crit-hits and both prove negative. Damage from the Type V Beam is 20 points and damage from the photon is 13 points. Now Ship B has only 16 hull points left. Ship B moves 3 hexes forward making the range 22 hexes and finds it takes a 14 with the solar flare and a 16 with the sunburst. Ship B rolls a 4 for the flare and a 20 with the burst. Next, Ship B rolls an 11 for its crit roll and because it has a BOBC with a crit-hit program, the hit is in a critical area of the ship. Now a roll must be made to see if it is a permanent crit-hit. Ship B rolls a 4 and once again because of the crit-hit program it is a permanent crit-hit. Ship A must number all the items on its ship and tell Ship B how many it has. Because Ship A has 8 items that can be hit, Ship B rolls an 8 sided die to see what item has been permanently crit-hit. Ship B rolls a 7 which is a Photon Storage Compartment on Ship A. Ship A now has 8 photons in its compartment (2 have already been fired) and so 24 six sided dice are rolled for damage because of the explosion of the 8 photons. After Ship B rolls 75 points of damage with the 24 dice the destruction of Ship A is obvious because it only had 38 hull points left. Now Ship B rolls a 4 sided die to see how many credits it won.

"BUYER'S GUIDE"

Conventional Ship Equipment

ITEM	Description/Damage	COST
Shield	-1 "to hit", -1 per dam. die	1,000-max of 3
Impulse Engine	Move ship 1 hex	500
Mini-Thruster	Move ship 2 hexes	1,250
Thruster	Move ship 4 hexes	2,000
Hyperspace	Ship appears randomly	1,500
Type I Beam	4 sided die of damage	500 per die
Type II Beam	6 sided die of damage	750 per die
Type III Beam	8 sided die of damage	1,000 per die
Type IV Beam	10 sided die of damage	1,250 per die
Type V Beam	12 sided die of damage	1,500 per die
Type VI Beam	20 sided die of damage	2,500 per die
Beam Recharger	Recharges laser beams	1,000 each
Cannon	Fires cannon shells	500
Cannon shells	2d6 of damage	25 each
Disperser	4d6 of damage	2,000
Missile Launcher	Launches nuc's & plasma	1,000
Nuclear Missile	20d6 of damage	1,000
Missile Thruster	Moves nuc's 4 hexes	250-max 2 per missile
Plasma	30 points of damage	750
Photon Tube	Fires Photons	1,000
Photons	3d6 of damage	50 each
Rocket Launcher	Fires 1 rocket pr/round	500
Tripod	Fires 3 rockets pr/round	1,250
Rockets	Damage dependent on range	25 each
WLTB(Whip-lash thunder bolt)	6d6 of damage	4,000

Solar Ship Equipment

ITEM	Description/Damage	COST
Solar Power Converter	Powers Solar Ships	1,000
Solar Generator	Allows for Solar Weapons	1,000
Solar Thruster	Move ship 3 hexes	1,000
Sunscreen Shield	-1 "to hit", -1 per dam. die	500-max of 3
Sunburst	4 sided die of damage	500 per die
Type I Flare	6 sided die of damage	750 per die
Type II Flare	8 sided die of damage	1,000 per die
Type III Flare	10 sided die of damage	1,250 per die
Type IV Flare	12 sided die of damage	1,500 per die
WLTB(Whip-Lash Thunder Bolt)	6d6 of damage	4,000

COMPUTER EQUIP.

BOBC	Basic-on-board-computer	1,000
Type I Program	Crit-hit-Program	1,000
Type II Program	History Program	1,500
Type III Program	Multi-Ship Program	1,000
Type IV Program	Accurator Program	1,000
Type V Program	Master Program	4,000

RAMMING EQUIPMENT

Rammer	Allows ship-to-ship rams	1,500
De-Rammer	Take ½ dam. from rams	1,500

Additional Hull Points

50 per additional point

Crit Hit 2D6 (2, 12)
Σ BOBC (2, 3, 11, 12)

Perm. Crit Hit 1D6 (5, 6)
Σ BOBC (4, 5, 6)

TO HIT CHART

RANGE

(In Hexes)

ATTACK FORM

	0	1	2	3	4-5	6-7	8-10	11-15	16-20	21-25	26-30	31-35	36-40	41-45	46-50	51+
Photon (51+)	2	3	4	5	6	7	8	9	11	12	13	14	16	17	19	20
Laser Beam (30)	2	3	4	5	6	8	10	12	14	16	18	—	—	—	—	—
Disperser (20)	2	3	4	5	7	10	12	15	18	—	—	—	—	—	—	—
Plasma (10)	0	2	4	7	9	13	16	—	—	—	—	—	—	—	—	—
Cannon (3)	2	5	9	14	—	—	—	—	—	—	—	—	—	—	—	—
WLTB (30)	2	3	4	6	8	10	12	14	16	18	20	—	—	—	—	—
Solar Flare (45)	2	3	4	5	7	9	10	12	13	14	15	16	18	20	—	—
Sunburst (30)	2	3	4	5	6	8	10	12	14	16	18	—	—	—	—	—
Rocket* (5)	6	5	4	3	2	—	—	—	—	—	—	—	—	—	—	—

* Rockets need no "to hit" roll, the numbers on the chart represent points of damage taken.
